

Teacher(s):
Graham-Jones, Nash,
Loving, Johnson

Subject: Biology I Unit/Lesson: Cells as a System

MS-CCR Standard(s):

**BIO.1C.2 Investigate to compare and contrast
prokaryotic cells and eukaryotic cells, and plant, animal,
and fungal cell**

Essential Question(s):

How does passive transport work?

How does active transport work?

How does the

Sentence Stems (

);

Scholars will be placed into groups during labs and individual work to aid in peer-peer interactions. The time for teacher-peer interaction will be guided practice.

collapsed onto on the floor. Volunteers quickly gave Michelle water for dehydration. Soon, her condition

Get student thinking
Understand the objectives of
the unit

worsened, and Michelle was rushed to the hospital, where she was gripped by a seizure and went into a coma.

Why did treating Michelle with water make her condition worse?

Clue #1: At the hospital, a sample of Michelle's blood was drawn and examined. The red blood cells appeared swollen. At this point, what do you think has happened to Michelle's cells? What cell organelle is most responsible for what occurred in Michelle's body?

15 min

Model/Input

(Slide deck/Direct instruction)

Goals:

Students develop understanding of the content
Observations and experiences are discussed and critiqued
Students develop vocabulary
Students are able to connect the content presented to previous experiences

Activity**Input:**

Introduce Osmosis as a type of facilitated diffusion. Explain that cells contain proteins called aquaporins that allow water molecules to pass.
Explain how osmosis works using the experimental image below.

Key points: The barrier is permeable to water but not sugar.
The concentration of solutes is different on both sides of the barrier.
Water will make net movement toward the concentrated sugar solution.

Introduce osmotic pressure. Explain how osmotic pressure causes cells to shrink or swell. Use Figure 8-20 to explain the effects of osmosis on animal cells and how it differs from the effects on plant cells. Students should understand that cells swell in hypotonic solutions, cells shrivel in hypertonic solutions and remain the same in isotonic solutions. Create an anchor chart (see example in Resource Guide).

Check for Understanding (Embedded)

(Questions/Informal Check)

CHECK FOR UNDERSTANDING: If an orange dye capable of passing through the membrane was added to the left side of the tube shown in the lesson, how would it be distributed at the end of the experiment?

Elaborate (We Do)

20 min

(Extend the learning)

Goal:

Students use their newly obtained knowledge to propose solutions and extend their learning to new situations

Activity

[Microsoft Word - Transport in Cells B1Y vM2.doc \(dvusd.org\)](#)

TTW complete handout with scholars to build their knowledge on hypertonic, hypotonic, and isotonic conditions.

Why Can't Mrs. M eat Ice Cream?

Milk and dairy products are composed of a sugar called lactose. To break down that sugar, cells must be able to produce the enzyme: lactase.

Without lactase, the milk sugar is not broken down and can cause symptoms like stomach aches, gas, and vomiting.

What do you think the treatment is for someone who is "lactose Z
